Dear Alumni and Friends of the UH IE Department,

I am proud to highlight the many exciting accomplishments of the UH IE community.

Our department offers excellent educational programs for students who are interested in careers that apply mathematical knowledge to improving system performance. Both of our undergraduate and graduate programs are highly ranked in various national rankings including U.S. News and World Report.

Our faculty and staff are dedicated to serving students and working for their success. Our world-renowned faculty members work on cutting-edge research in health, energy, homeland security, nano-materials, manufacturing, supply chain and safety engineering. They collaborate with strategic partners in the Texas Medical Center and other private industry members in Houston.

Thank you for being a friend of the UH IE Department. I look forward to hearing from you and seeing you at upcoming departmental, college and University events!

Warm Regards,

Gino J. Lim, Ph.D.
Professor & Chair
Department of Industrial Engineering
Cullen College of Engineering
University of Houston

---

UH IE BY THE NUMBERS

- #48 Best Industrial Engineering Program in the U.S. (Source: U.S. News and World Report)
- 80% of UH Engineering Undergrads are Employed Within 1 Year of Graduation
- 22:1 University-wide Student to Faculty Ratio
- 133 Graduate Students + 105 Undergraduate Students = 238 Total Students

CORE RESEARCH AREAS:
- Medical Decision Making
- Homeland Security, Port Security
- Energy
- Reliability and Maintenance
- Logistics and Transportation, Supply Chain
- Manufacturing

OPTIMUM
An engineering building at the University of Houston has been renamed the Durga D. and Sushila Agrawal Engineering Research Building in recognition of a gift that is providing ongoing support for faculty, students, research and building operations.

The $51 million building, which opened in 2017, already had a floor named for the couple. Durga D. Agrawal (M.S. ’69, Ph.D. ’74), founder of Piping Technology & Products Inc., is a member of the UH System Board of Regents and a former member of the Texas Higher Education Coordinating Board. After arriving in Houston from India in 1968 with a bachelor’s degree in mechanical engineering from the Delhi College of Engineering, Agrawal earned a master’s degree and a Ph.D. in industrial engineering from the UH Cullen College of Engineering.

Agrawal’s message to Cullen College students is “to always be optimistic; one can achieve any goal with hard work, persistence and determination. As alumni, we must keep the torch of knowledge, excellence and innovation growing and glowing.”

Joseph W. Tedesco, Elizabeth D. Rockwell Dean of the Cullen College, said the gift’s impact “will be nothing short of transformational.”

“It will allow us to expand and enhance our laboratory and classroom facilities, recruit some of the world’s greatest engineering minds as students and faculty members, and develop new and innovative academic programs,” he said. “This gift will boost our capacity to conduct research that directly impacts the quality of life across the greater Houston area and beyond.”
UH IE ALUMNUS LEADS UHCL’S COLLEGE Of Science and Engineering

Miguel A. Gonzalez ('83, MSIE '85, Ph.D. IE '95) recently took the helm as the new dean of the College of Science and Engineering at University of Houston-Clear Lake. He will also serve as a professor of engineering. Accepting the appointment brought Gonzalez full circle to his roots. For him, his new job is more of a homecoming.

Gonzalez earned his bachelor’s and master’s degrees in industrial engineering as well as his Ph.D. in the same discipline from the UH Cullen College of Engineering. It’s also where he got the teaching bug after working as a teaching fellow during 1983-85. He served as an assistant professor for part of 1999 at the Cullen College. From 1996 to 2014, Gonzalez joined the family business Citro Mexico, one of Mexico’s largest citrus processing operations. There he served in various roles, rising to the position of Citro Mexico’s president and chief corporate executive officer. He also served as assistant professor of industrial and systems engineering at the University of Memphis from 1996 to 1998.

Prior to joining UH-Clear Lake, Gonzalez spent 20 years at the University of Texas Rio Grande Valley – and its legacy institution, The University of Texas - Pan American in Edinburg. He first served as an assistant professor and then director of UTPA’s manufacturing engineering program. Later, Gonzalez was involved in several initiatives in the community, including serving as director of the Rio Grande Regional Center for Innovation and Commercialization. Through these activities, he fostered university partnerships with existing and developing industries — something he also wants to do at UHCL.

Gonzalez eventually became an endowed professor; dean of UTPA’s College of Engineering and Computer Science; and associate vice president for research at what is now the UT Rio Grande Valley – a result of UTPA’s 2015 merger with UT-Brownsville.

He brings all this vast and diverse experience to his position at UHCL with the aim of making a difference. He wants the college to support students, the institution and the surrounding community by building on existing programs and forging new partnerships to make the most of opportunities. But for Gonzalez, the true driving force is student success.

MITIGATING DISASTER: Paper on Mass Evacuation Receives International Recognition

Industrial engineers make things and systems better for people. In Gino Lim’s case, it can involve reliable mass evacuation planning in situations of critical emergencies. According to Lim, who is a professor and the chair of the industrial engineering department at the UH Cullen College of Engineering and Hari and Anjali Agrawal Faculty Fellow, a reliable evacuation plan is key to successful mass evacuation.

Lim, his doctoral student Ayda Darvishan and his former doctoral student Mukesh Rungta (MSEE ’09, Ph.D. IE ’12), now with the international company AirLiquide, have been working with engineers at the City of Houston and Texas Transportation Institute to better understand traffic congestion triggered by mass evacuation in the Greater Houston Area.

Their work has resulted in a paper that was published by the Institute of Industrial and Systems Engineers (IISE) in two of its prestigious publications. It appeared in the June 2019 issue of IISE Transactions and was also featured in the Research section of the institute’s Industrial and Systems Engineer magazine.

Titled “A robust chance constraint programming approach for evacuation planning under uncertain demand distribution,” the paper focuses on an evacuation planning problem where the number of actual evacuees (demand) is unknown. It then develops a comprehensive network flow-based evacuation planning approach to address demand uncertainty not only for the case that mean and variance of demand distribution are known, but also for the case that additional information – such as the demand uncertainty with symmetry and/or support information – are available.

Using this additional information, the authors prove that tighter bounds can be achieved on evacuation clearance time while providing an optimal evacuation plan with information like route selection, time to evacuate, and how many cars should each evacuation path accommodate at each time interval during the course of evacuation.

Gonzalez earned his bachelor’s and master’s degrees in industrial engineering as well as his Ph.D. in the same discipline from the UH Cullen College of Engineering. It’s also where he got the teaching bug after working as a teaching fellow during 1983-85. He served as an instructor of industrial engineering 1986-88 and 1993-95, and then as a visiting assistant professor for part of 1999 at the Cullen College. From 1996 to 1994, Gonzalez joined the family business Citro Mexico, one of Mexico's largest citrus processing operations. There he served in various roles, rising to the position of Citro Mexico's president and chief corporate executive officer. He also served as assistant professor of industrial and systems engineering at the University of Memphis from 1996 to 1998.

Prior to joining UH-Clear Lake, Gonzalez spent 20 years at the University of Texas Rio Grande Valley – and its legacy institution, The University of Texas - Pan American in Edinburg. Using this additional information, the authors prove that tighter bounds can be achieved on evacuation clearance time while providing an optimal evacuation plan with information like route selection, time to evacuate, and how many cars should each evacuation path accommodate at each time interval during the course of evacuation.
A collaboration between the University of Houston and the Harris Health System Center for Innovation offered undergraduate and graduate students with the UH Department of Industrial Engineering department an opportunity to help solve a real-world problem in a hospital emergency center.

Suresh Khator, professor of industrial engineering and associate dean for graduate programs and computing facilities in the UH Cullen College of Engineering, and Dr. Stephen Spann, founding dean of the UH College of Medicine, were recognized at the Harris Health System Innovation Summit for a project to improve the flow of psychiatric patients through the emergency center at Ben Taub Hospital.

Khator said the project grew from conversations between Spann and Harris Health executives and began last fall with undergraduate students in his simulation science class studying patient flow and talking with hospital staff to understand how things worked. Areas of study included searching for bottlenecks and ways to increase efficiency and productivity.

Graduate students from Khator’s class have continued the project. According to Poria Dorali, a doctoral student in industrial engineering, he and other graduate students have gathered patient information and other data, as well as spent time in the waiting room and outside the hospital, observing and talking with patients. The information will be added to a computer model, allowing them to incorporate proposed changes — adding a staff member, for example, or combining some functions — to determine the impact.
On April 25, the UH Cullen College’s industrial engineering (IE) department hosted its annual Honors and Awards Banquet at the UH Hilton. The formal affair brought together IE students, alumni, faculty and staff to celebrate the outstanding achievements made by students with scholarships and awards.

Department Chairman Gino Lim welcomed guests with opening remarks and provided department updates. UH Board of Regents member, Durga D. Agrawal (M.S. ’69, Ph.D. ’74), served as the keynote speaker for the evening. The event also recognized outstanding staff and faculty members in the department.

John Vasek, UH Institute of Industrial Engineers student chapter treasurer, recognized instructional associate professor Taewoo Lee with the Outstanding Teacher Award. Instructional Assistant professor, Yaping Wang, welcomed IE student chapter officers and introduced the new 2019-2020 officers for the organization.

The event was sponsored by Cintas, Tenaris and the UH Cullen College of Engineering.

Meet the 2018-2019 Honorees:

- Brij & Sunita Agrawal Scholarship
  - Poria Donati
  - David Luo
  - Shengbin Wang

- Dr. Ben Amaba Scholarship
  - Tue Tran

- Durga & Sushila Agrawal Scholarship
  - Navid Ahmadian
  - Ayda Davvini
  - Saba Ebrahimi
  - Chunfeng Cui
  - Saeedin Kharazi
  - Dan Qi
  - Vishal Sachedeva
  - Harsh Shah
  - Andrew Smith
  - Maryam Torabbeigi

- George & Myrajane Hall in IE Scholarship
  - Rosangel Limongi Cifelli

- Prem Dewan Scholarship
  - Antish Kumar Patel

- PVF Roundtable Scholarship
  - Celine Gebara
  - Laila Hajjou
  - Karla Grimas Teira

- Sam Scharff Scholarship
  - Michele George
  - Christian Grant
  - Shalini Lakshmi

- Shoaleh Shirvani Nosrati & Asghar Nosrat Endowed Scholarship
  - Zahed Shahmoradi

- Outstanding Graduate Teaching Assistant-Award Finalists
  - Poria Donati
  - Amanda Khem
  - Navid Ahmadian
  - Zahed Shahmoradi

- Outstanding Teacher Award
  - Dr. Taewoo Lee
Taewoo Lee, assistant professor of Industrial Engineering at the UH Cullen College of Engineering, was awarded two grants to address critical issues in healthcare by the National Science Foundation.

The first grant, totaling $254,672, will support Lee’s studies on making eye care more accessible to at-risk patients with diabetic complications. Lee’s direct portion of the grant totals $169,792. The project, titled “Collaborative Research: Optimal Design of a Teleretinal Screening Program for At-Risk Patients”, will aim to develop a comprehensive, quantitative modeling framework for an optimal design of a teleretinal screening program from both societal and individual patient’s perspectives. The ultimate hope is that the results of research will provide insights into how clinical guidelines can adapt to advances in retinal imaging and how the resources can be shifted to high-risk population in the next-generation of DR screening systems.

The second grant will fund a project titled “Performance Incentives for Organ Transplantation Centers”. The total funding for the project is $386,251, of which $84,880 is allocated to Lee, who is the lead UH investigator. The project’s goal is to ensure more effective use of donor transplant organs. The hope is to gain a deeper understanding of current pay-for-performance initiatives in the transplantation system and in other healthcare settings by examining the interplay between societal goals and provider incentives. This research will build a bilevel optimization framework to model the interaction between the societal perspective and the goals of individual transplant centers to determine incentives that simultaneously maximize societal and center-level benefits. This framework (i) formulates the societal perspective (the leader) that quantifies the utility-adjusted, national benefit and determines societal-ly optimal incentive parameters, and (ii) models each transplant center’s perspective (the followers) as a sequential, stochastic decision-making problem so as to maximize its transplant volume subject to the societal incentives. By aligning the different views and agendas, and smartly designing systems to make better, more efficient processes, patients will be able to experience a higher level of care.
RESEARCH AND PUBLICATIONS

Deepwater Horizon, the worst oil spill in U.S. history, was caused by a mix of factors including human error, confusing policies and equipment failure. According to a New York Times article, poor maintenance and disregarded inspection schedules was part of the problem. The 2016 movie of the same name inspired a four-year research project from the National Science foundation to explore equipment failures in capital-intensive industries, specifically dynamic environments. As a result, Feng was awarded $627,102 for a UH Cullen College associate professor of industrial engineering, to conduct research on when and what preventive action—such as an inspection or a part replacement—should be taken. All this information should help achieve greater efficiencies and help extend the equipment life while creating a safer work environment.

Inspired by Hollywood’s “Deepwater Horizon,”

The University of Houston Cullen College of Engineering addresses key challenges in energy, healthcare, infrastructure and the environment by conducting cutting-edge research and graduating hundreds of world-class engineers each year. With research expenditures topping $26 million and increasing each year, we continue to follow our tradition of excellence in spearheading research that has a real, direct impact in the Houston region and beyond.
